

Table Osm.2

Hierarchical multiple regression analysis with the residual change scores in anti-Semitism as DV testing national glorification as a moderator of the interaction between the manipulation of ongoing suffering and bogus pipeline condition.

Predictor	<i>B</i>	<i>SE</i>	95% CI	<i>t</i>	<i>p</i>
Constant	-0.01	0.11	[-0.23, 0.21]	-0.10	.918
Step1					
Suffering Manipulation (S)	-0.01	0.22	[-0.45, 0.43]	-0.04	.968
Bogus Pipeline (BP)	0.13	0.22	[-0.32, 0.57]	0.57	.573
National Glorification (NG)	-0.14	0.13	[-0.39, 0.11]	-1.10	.275
Step 2					
S × BP	0.25	0.44	[-0.64, 1.13]	0.56	.578
S × NG	-0.30	0.25	[-0.80, 0.21]	-1.18	.244
BP × NG	0.32	0.25	[-0.19, 0.82]	1.26	.213
Step 3					
S × BP × NG	0.87	0.50	[-0.13, 1.87]	1.73	.088

Note: Coefficients are taken from the final model, $R^2 = .06$, $F(7, 75) = 0.69$, $p = .679$. We effect coded the experimental factors ongoing suffering (ongoing suffering = 0.5, *no* ongoing suffering = -0.5) and bogus pipeline (bogus pipeline = 0.5, control = -0.5). National glorification scores were standardized before computing all possible two-way products and the three-way interaction.
