

Table Osm.4

Hierarchical multiple regression analysis with the residual change scores in anti-Semitism as DV testing guilt proneness as a moderator of the interaction between the manipulation of ongoing suffering and bogus pipeline condition.

Predictor	<i>B</i>	<i>SE</i>	95% CI	<i>t</i>	<i>p</i>
Constant	0.03	0.12	[-0.20, 0.27]	0.28	.784
Step1					
Suffering Manipulation (S)	-0.06	0.24	[-0.54, 0.41]	-0.26	.792
Bogus Pipeline (BP)	0.05	0.24	[-0.43, 0.52]	0.19	.850
Guilt Proneness (GP)	0.00	0.12	[-0.25, 0.24]	-0.03	.977
Step 2					
S × BP	0.25	0.47	[-0.69, 1.20]	0.53	.596
S × GP	-0.26	0.24	[-0.74, 0.22]	-1.08	.285
BP × GP	-0.13	0.24	[-0.61, 0.36]	-0.52	.602
Step 3					
S × BP × GP	0.51	0.48	[-0.46, 1.47]	1.05	.297

Note: Coefficients are taken from the final model, $R^2 = .05$, $F(7, 75) = 0.52$, $p = .814$. We effect coded the experimental factors ongoing suffering (ongoing suffering = 0.5, *no* ongoing suffering = -0.5) and bogus pipeline (bogus pipeline = 0.5, control = -0.5). Guilt proneness scores were standardized before computing all possible two-way products and the three-way interaction.
